1)
Temporarily remove the background-color declaration from one review box. Submit before-and-after screenshots, the exact CSS rule that paints the box afterward, and an explanation using selector specificity and source order. Restore the rule before submitting.

Before

```css
.review-main {
    background-color: #E1D697; /* This rule paints the box... but then you remove it...*/
    border: 2px solid gray;
    padding: 8px;
    margin-bottom: 10px;
}
```

After

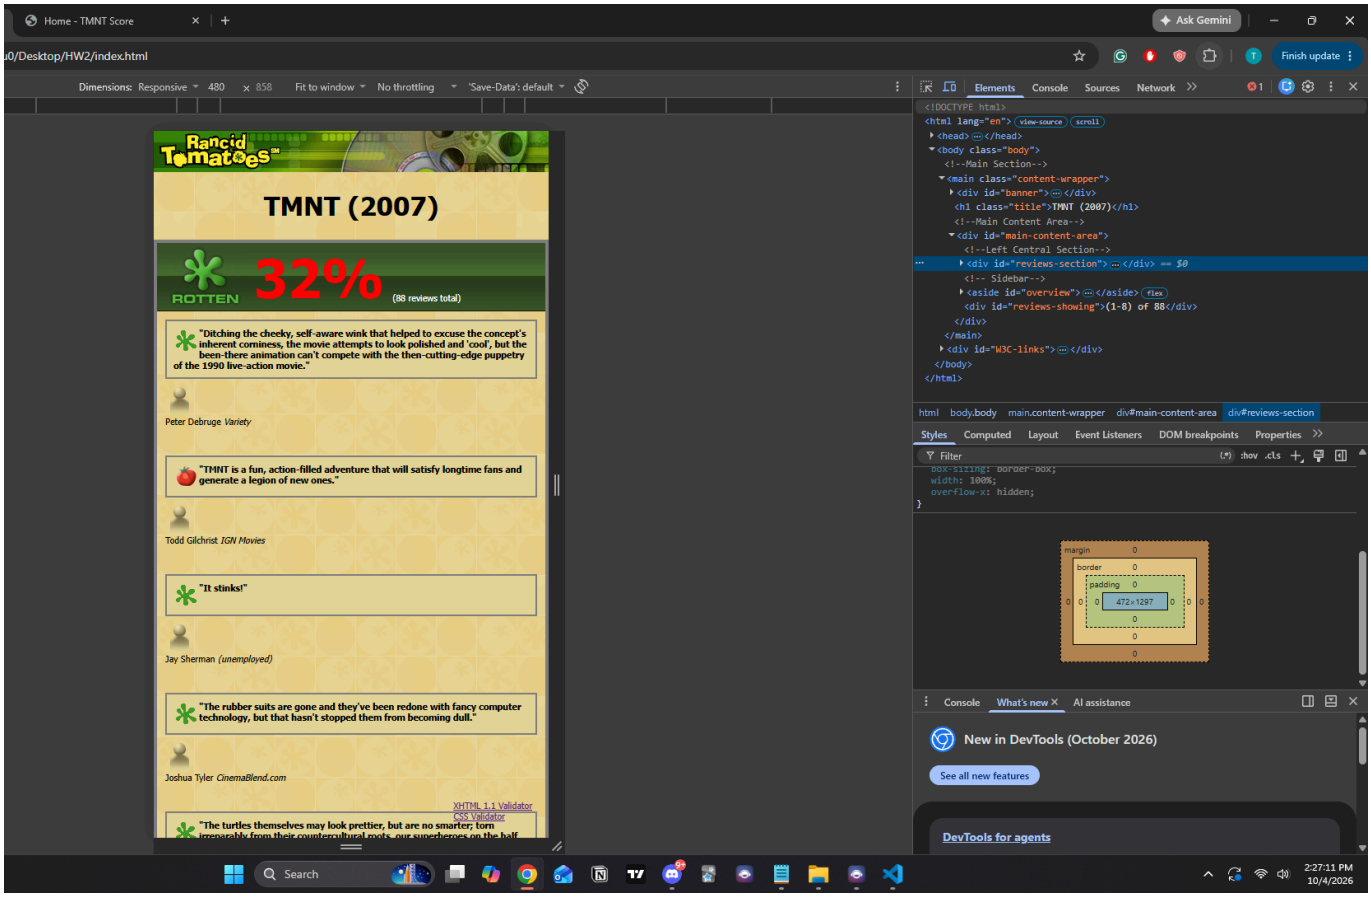

```css
body {
    margin: 0;
    padding: 0;
    font-size: 8pt;
    font-family: Tahoma;
    background-image: url('images/background.png'); /* This is the rule used afterwards*/
```

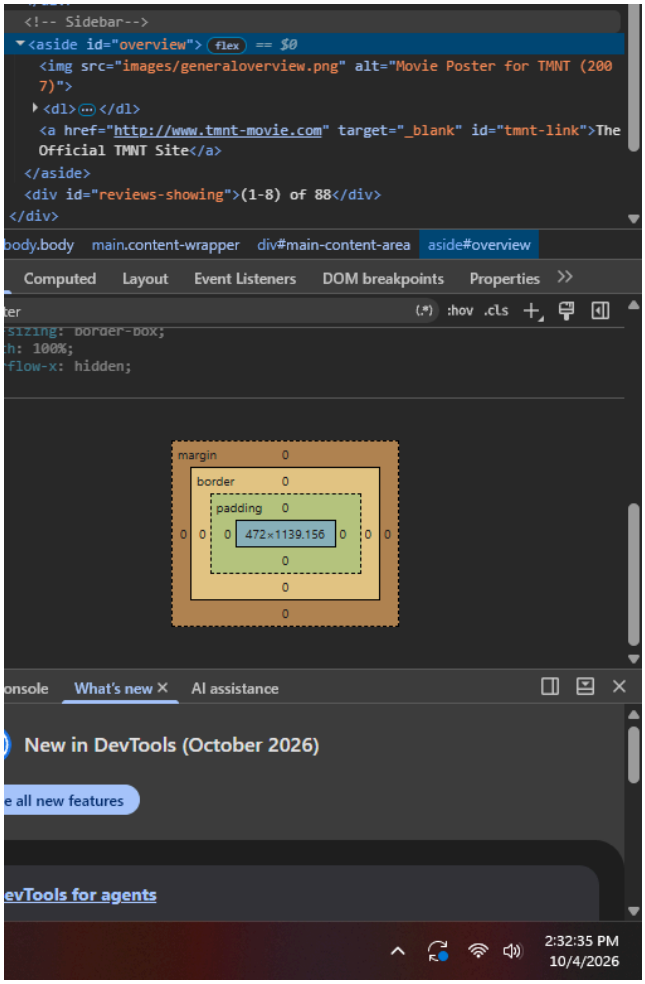

In terms of source order and specificity, there isn't a CSS rule with a higher specificity, like an ID that would give the box another background color. There isn't one with a lower specificity either. Because of this, it adopts the parent container's background, which is transparent.

2)

The Fix

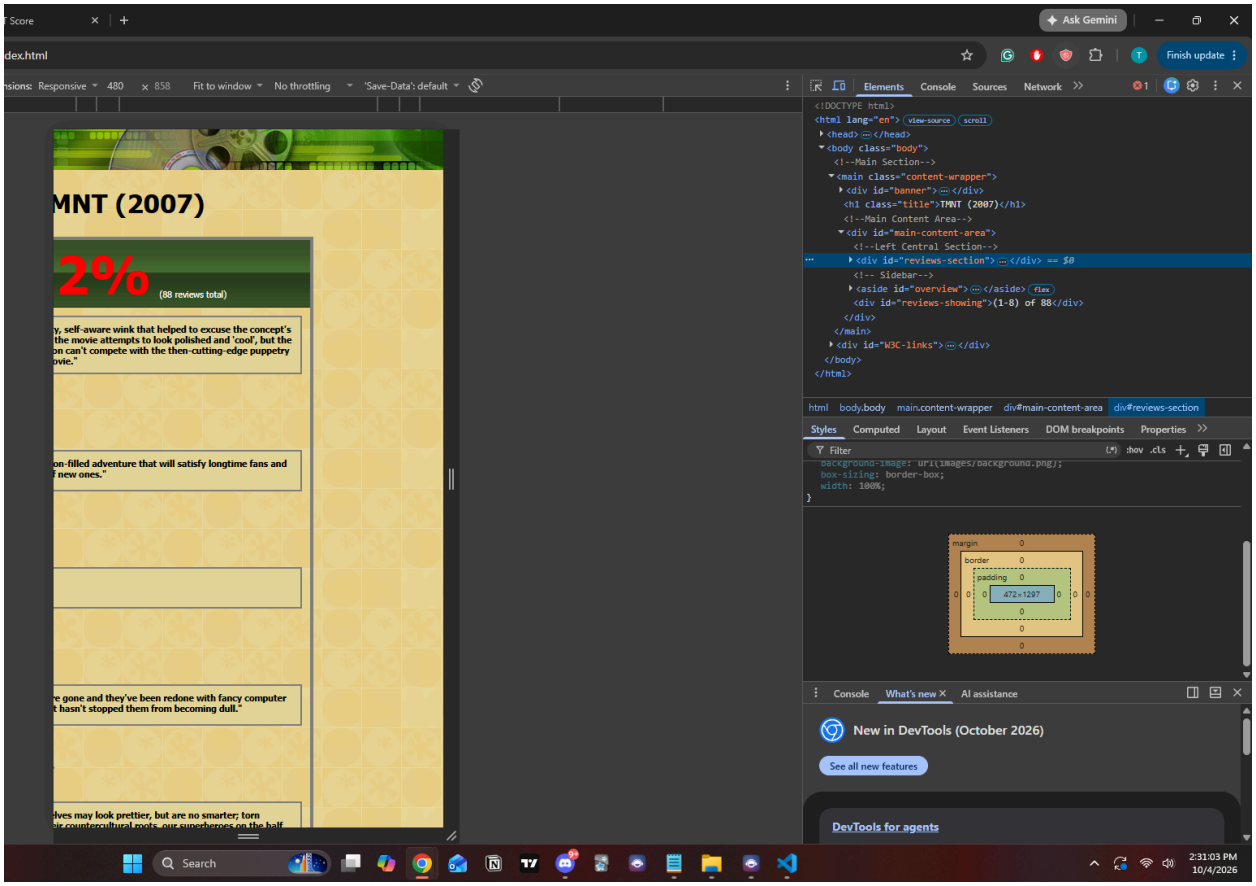

Width: 472px

Width 472px:

I implemented “`overflow-x: hidden;`” on the body and html. This prevents element overflows from creating horizontal scrolling. By removing this, the following happens…

…The width says the same, but now there is horizontal scrolling.

Another thing I did was make the review section only 1 column with:
`grid-template-columns: 1fr;`
This will force vertical scrolling.
